The "theory of evolution" is actually a network of theories that created the research program of biology. Comparative anatomy investigates the homologies or inherited similarities, among organisms in bone structure and in other parts of the body.

Evolution is doing the same with the riddle of how the living world took shape. Its conclusions are tentative, i. Chance plays a part in evolution for example, in the random mutations that can give rise to new traits but evolution does not depend on chance to create organisms, proteins or other entities.

Genetic information contained in the DNA can thus be investigated by examining it. Swedish botanist Carolus Linnaeus devised the hierarchical system of plant and animal classification that is still in use in a modernized form.
